

WorksheetNo()

Name	Title: module 11 climate change	Date
Semester.....	W S type: Outstanding worksheet	Class:1 st sec
Learning Outcomes: 1- Reading: To identify the main idea. 2- Reading: To summarize a text.		

Read only the topic sentences of each paragraph in this newspaper article. Then choose the best summary of the text a, b or c.

Can science save the day?

Scientists are thinking the unthinkable: can engineering projects save the world from global warming? How can we save the planet if we can't reduce our production of carbon? There are two main approaches to this question. One approach involves the removal of carbon from fossil fuels fossil fuels. There are two ways to do this. The first involves removing carbon from the fuel before it is burnt. Currently, this happens in Norway where CO2 is removed from natural gas as it comes out of the ground. The second involves capturing the CO2 when it is produced by Power stations both of these methods are expensive but they could reduce the CO₂ produced by 90 percent.

The other approach is to reduce the amount of solar energy which hits the Earth. Some scientists have suggested putting a giant mirror in space. Others have suggested increasing the number of clouds over the oceans because they reflect back the sun's rays. This Last technique has the advantage of being easy to stop and start.

There are many unanswered questions about these ideas. They must be safe and not cause more damage. Any large engineering Projects mustn't harm the Earth or the life on It. Otherwise, the cure of global warming might be worse than the original illness.

- A. Scientists have had several ideas for fighting global warming, such as removing carbon Iron fuel. When the plans are finished, they will need to be safe and not expensive.
- B. Scientists are designing engineering projects to fight global warming. There are two approaches: removing carbon from fossil fuels and reducing the solar energy that reaches the planet. The designs are not finished yet and should be safe.
- C. If we can reduce the carbon in fuel or the solar energy that hits the Earth, we can win the fight against global warming. There are many possible solutions to the problem. Governments haven't decided which plan to follow, but they want plans that are safe.
